## IDENTIFICATION

The product brand and type designation

KLR.HS70B

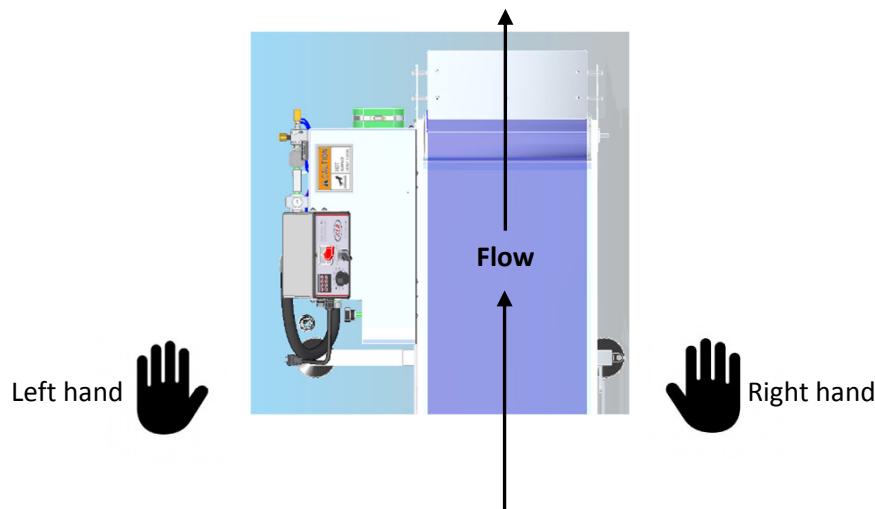

Bag sealer

Version of product/edition

Take note that every picture and every document were not especially for a left or a right version of this product. These instructions remain appropriate for the opposite. The left version is the mirror of the right.

**How to recognize left or right:**

For example, the following picture shows that the sealer is a left-hand version. You need to imagine yourself on the conveyor facing in the direction of the flow, and the hand that happen to be the side of the sealer give the answer.

**Serial number location:**

Located in the back, on top of the pneumatic modules.

## Name and address of the manufacturer

KLR SYSTEMS INC.

944 Heron Street,

Saint-Pie, Quebec, Canada

J0H 1W0

## Declaration of conformity with standards of products

Standard: CE

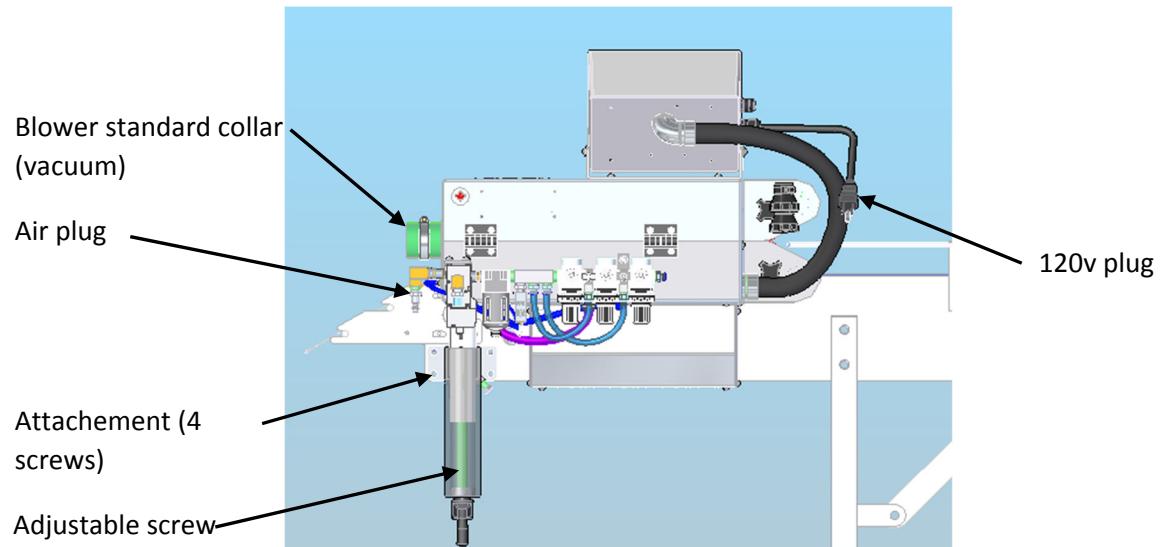

## Range of applications intended use and general functions

This device has been designed to remove the air mostly, seal plastic bag and cut the excess of the bag. It is also compact, lightweight so it can be rapidly replaced for maintenance without stopping the production. The automatic sealer can be installed directly on the conveyor or on a mobile unit.

## Dimensions and weight (for transport)

## INSTALLATION

The following picture shows how the sealer is mainly installed directly on a conveyor.

## Power for electricity and air data

Electric: 120v, 60 hertz, 1 phase

Pneumatic: 80 psi

## Location of the instructions

Instructions location: during the shipment of this device, his instructions are in the packaging itself. Also, this document is available online : [www.klrsystems.com](http://www.klrsystems.com)

## OPERATION

### Control panel

here you can control the temperature, the speed of the belts and turn on/off the sealer.

\*Temperatures are in Celsius (°C)

### On/off air pressure:

The heater won't turn on if the air pressure switch is off because of a pressure valve. This prevents the heater burning itself because there is no circulating air in the system. Simply turn on the air pressure first, and then the heater.

### Temperature controller

By turning on the heater, the temperature will gradually rise up to reach the temperature set point.

The temperature required for good result highly depend on the thickness of the bag and the speed of the conveyor. Basically, higher the speed of the conveyor, less time the bag will be engaged into the sealer. Raise the temperature when the bag takes less time to be sealed. Higher the thickness of the material, higher the temperature needs to be as well.

As the temperature rise to get to the set point. It is normal to see higher temperature few seconds and then go under few degrees. It will correct itself and be more precise gradually.

## Potentiometer Belt

The belt must go the same speed as the conveyor. One advice is to make either the conveyor and the sealer working. Take a bag and put it on the conveyor the way to engage into the sealer. Simulate the weight of the product by hand. You will see if the bag goes faster or slower than adjust the speed with the wheel on the control panel.

## SAFETY PRECAUTIONS

### Personal protective

**Air blower:** please, wear safety glasses when using an air blower for cleaning.

**Habit:** For more safety, Long hair should be tied. Use sleeveless clothes avoid shirt bottoms that could be driving into the moving part. Clothing can easily be driven into the sealer by the belt action.

**Sharp blades:** This machine is equipped with a ceramic blade inside. When blade handling, we highly recommend wearing cut resistant gloves due to extremely sharp blade in the design, there a feature that rotates the blade inside when the top part of the sealer is disassembled. This help safety but does not remove all danger. Consider removing the blade for more safety when needed (**see "blade replacement" further in the maintenance part to know how to remove it**)

### Security labels.

Safety labels are there for your safety, Keep them clean and legible. Do not remove them even if it is blocking line of sight. If you must replace a piece with a safety label on it, please order a label to replace it as well.

Hot surface: This machine uses high temperature in the normal conditions. One or multiple surfaces might be hot. These surfaces may be hot for several minutes after the sealer has been turned off.

We do recommend waiting 15 minutes after the shut off before doing any maintenance, cleaning and other operations.

Sharp blades inside: This machine uses a ceramic knife. Careful especially on maintenance operations because the knife is more likely to be exposed. Consider removing the blade for more safety when needed. Please use cut-resistant gloves.

## Safety Components

This machine is designed to be as safe as possible. Danger areas have been enclosed with cases or doors for better protections.

**Safety panel or safety doors:** As a safety component does not try to remove or unscrew them unless it is necessary for a maintenance operation. Do keep in mind to use pad lock during this procedure and to reassemble every single piece as it was when finished.

## MAINTENANCE AND CLEANING

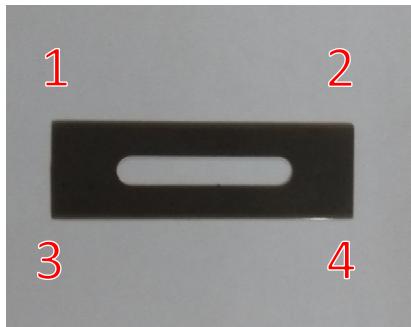

### Preventive maintenance schedule

Here is a quick way to take care of your machine by a preventive maintenance schedule:

PREVENTIVE MAINTENANCE SCHEDULE			
Location	Procedure	Time interval	Remarks
Belts	Verify the wear of each belt	3 months	None
Chain	Verify the wear of each chain	3 months	None
Cleaning	Air blow	daily	For more safety, wait 15 minutes to prevent burn
Blade	Check a sealed bag, check the quality of the seal. Check if it is a sharp cut. If not, change or rotate the blade	when needed, highly depends on the production.	Work with cut-resistant glove
Silicon wheels	Replace if it does not have a uniform seal and has bubbled inside.	2-3 months	None

## Blade replacement

Before changing the blade, keep in mind that the blade has technically four sides to be used before it wore down. It is made of ceramic, so it is worn resistant;

Here are the steps to remove/replace/rotate the blades:

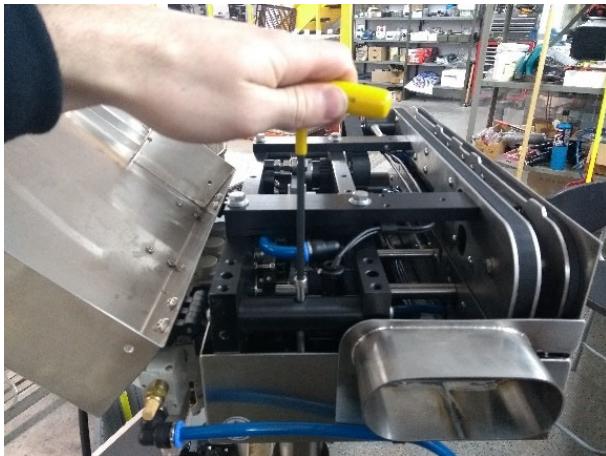

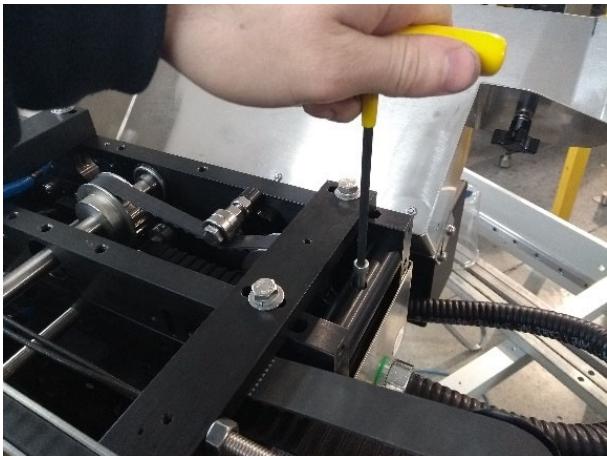

- Turn OFF the sealer and wait at least 15 minutes;
- Unplug the power cord;
- Unscrew both hand screws from the vacuum chamber (vacuum chamber is an option on purchase), then remove the vacuum chamber;

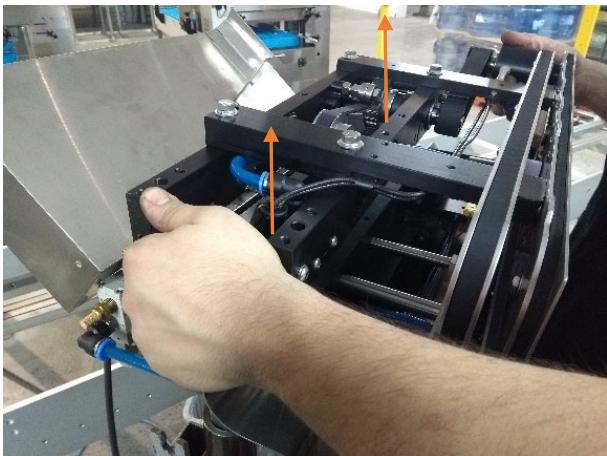

- Open the top plate;

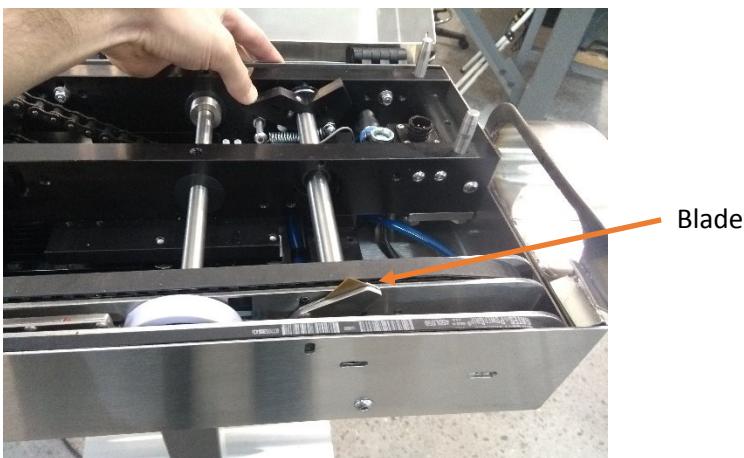

- Unscrew two socket cap screws that hold both top and bottom assembly together;

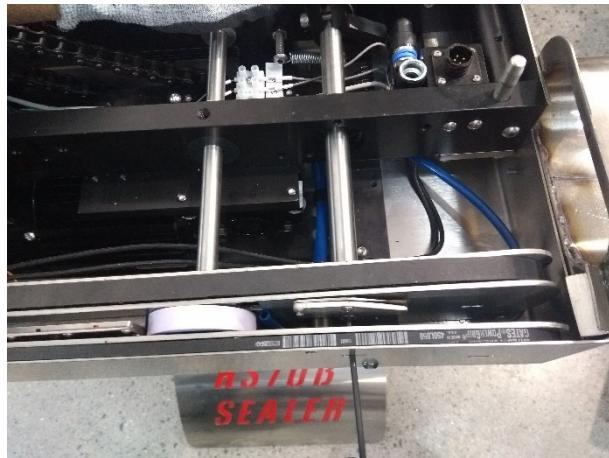

- Remove the top assembly;

- Careful, this is a safety purpose mechanism. When the top assembly is installed, the blade is raised;

- Unscrew 3 screws from the blade holder;

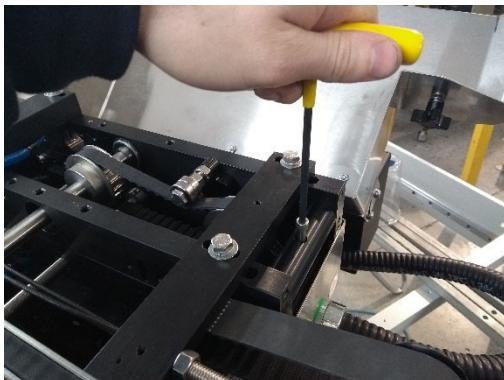

- Remove/replace/rotate the blade;

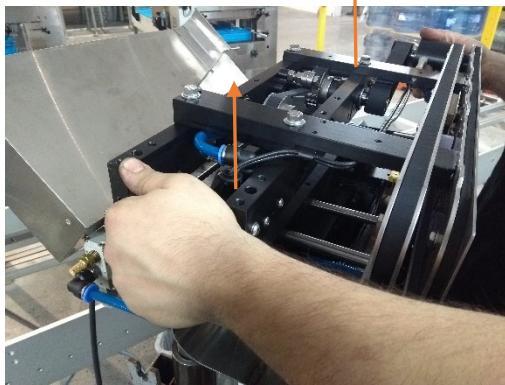

### Disassemble the top part

- Remove the vacuum chamber;
- Open the top of the sealer;
- Unscrew two (2) main screws with a 3/16 Allen key;

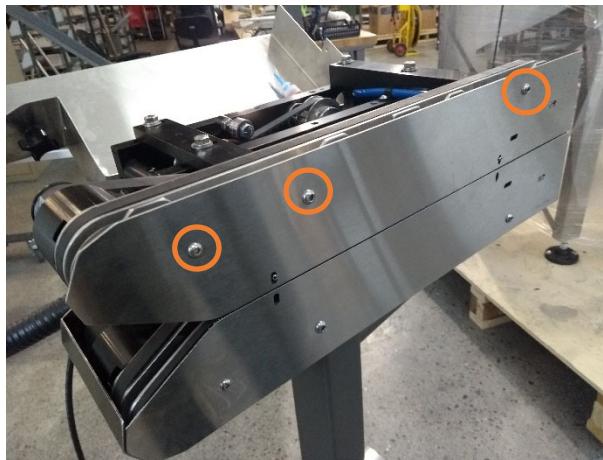

- Remove top part;

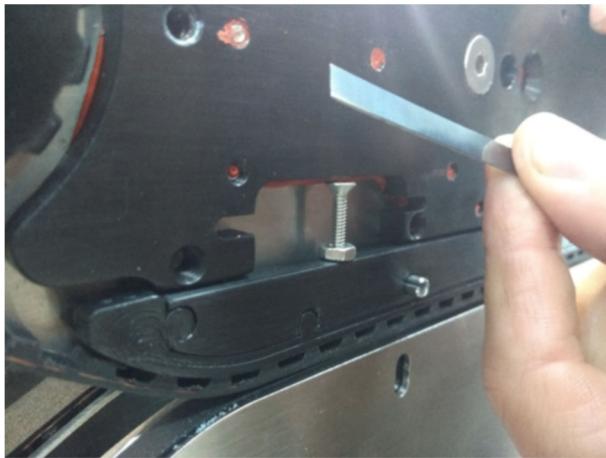

### Silicon wheel replacement (same procedure for heating blocks)

In the following steps, only the top part is shown to avoid repeating. Bottom part is the same except there are NO springs.

- Unscrew both hand screws from the vacuum chamber (vacuum chamber is an option on purchase), then remove the vacuum chamber. **See page 6 for pictures;**
- Remove those three screws (one 10-32 and two  $\frac{1}{4}$ -20), then remove the plate;

- Remove both (2) springs;

- Remove the belt skate;

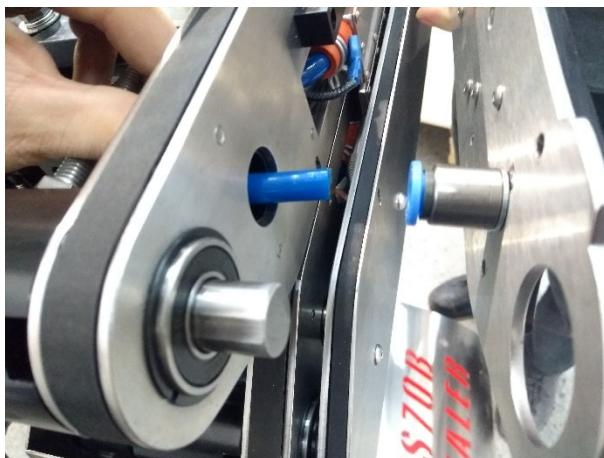

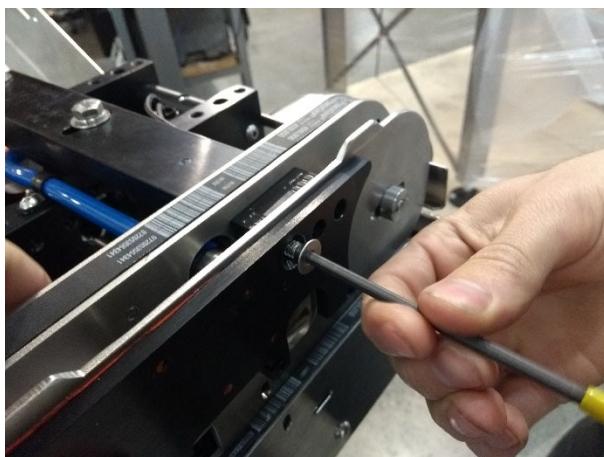

- Remove the belt and the plastic wheel;

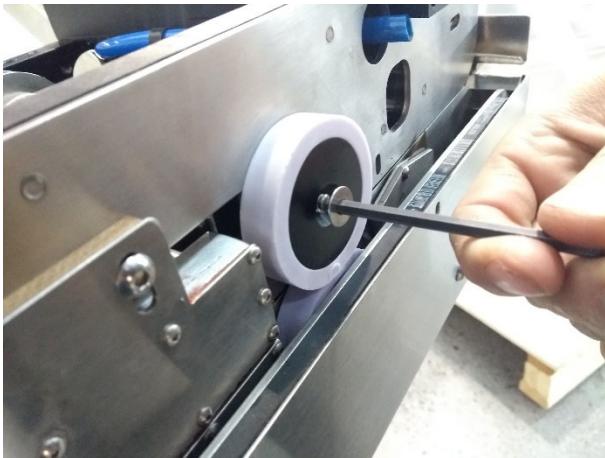

- Unscrew two set screws on the driving wheel and remove it, **careful** when you reassemble it, there is a flat on the shaft to receive one of the set screws;

- Unscrew both screws of the guide and unplug each air hoses (**The blue lip of the hoses fitting needs to be pressed to be able to remove the hose**);

- You have access to the silicon wheel, replace the wheel (1 screws);

- Follow the exact same steps but reversed to reassemble.

## Explanations

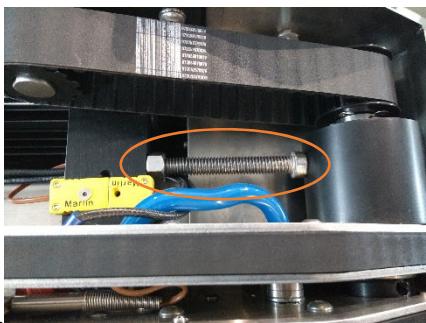

### Pneumatic explanation:

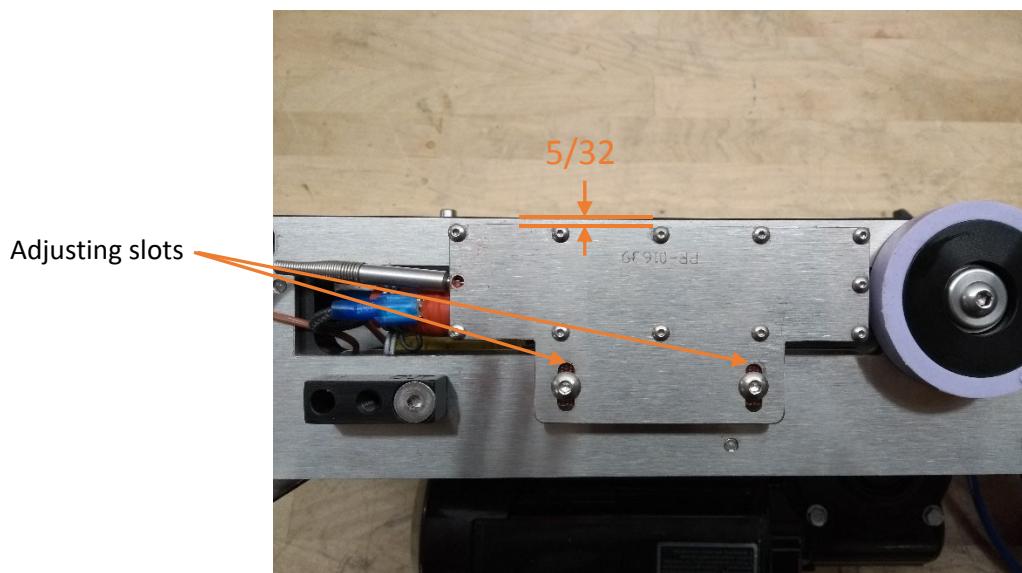

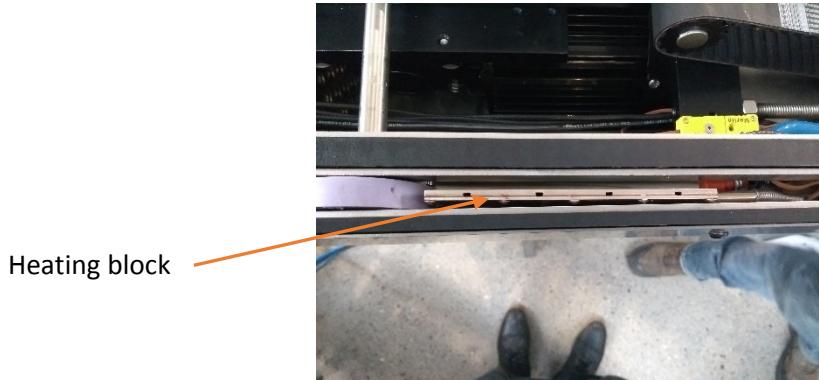

1. Venturi (optional)
2. Cooling blowers
3. Heating blower
4. Pressure sensor
5. Water separator
6. Shut off valve

### Things to know:

- Top and bottom parts are mirroring each other except: the cutting blade is at the bottom; silicon wheel is only driven at the top (bottom one is free) and there are springs for the belt at the bottom as well.
- This screw is NOT an adjustable screw or a tensioner. It has been fixed once in the assembly, and it is there to hold that cylinder part.

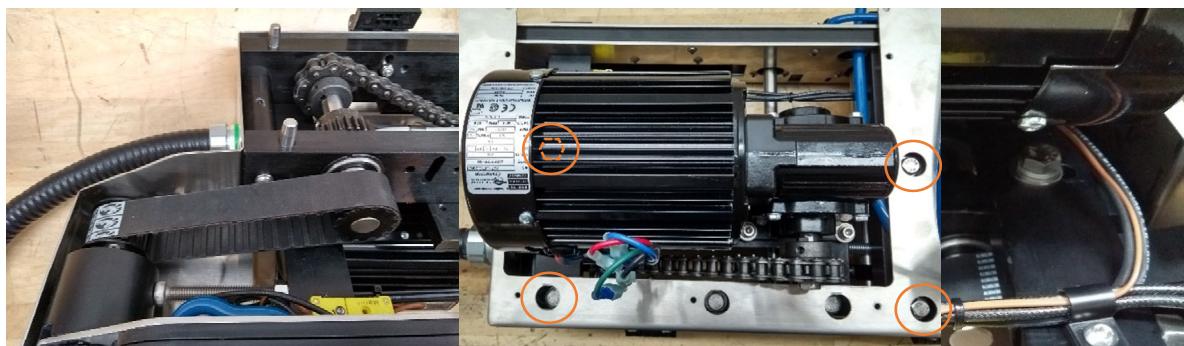

- Heating blocks must be adjusted this way:

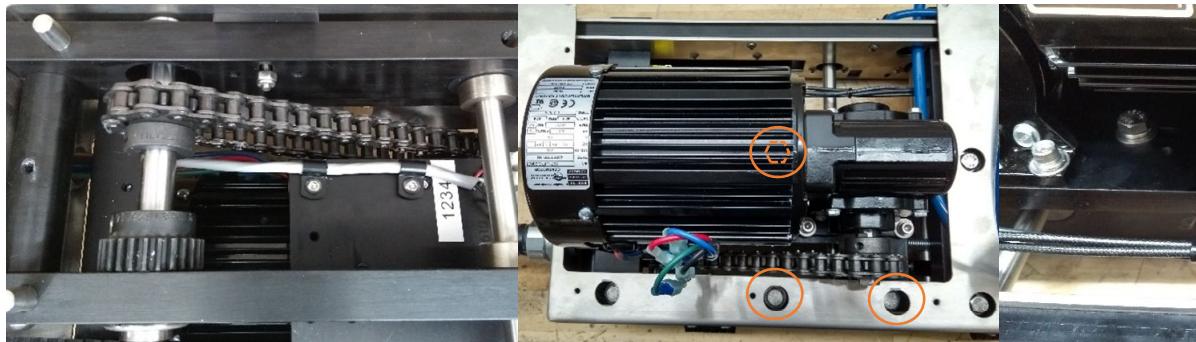

### Replace driving belts

Four (4) bolts are there to hold the tension of the belt of the bottom part (same thing for the top). See second picture.

## Replace chain

Three (3) bolts are there to hold the tension of the chain

## MAINTENANCE AND REPARATIONS BY TECHNICIANS FROM KLR SYSTEMS INC.

### Address and contact information for service technicians

For technical support or any other questions:

KLR SYSTEMS INC.

944 Heron Street,

Saint-Pie, Quebec, Canada

J0H 1W0

(450)-388-0404

[Info@klrsystems.com](mailto:Info@klrsystems.com)

[www.klrsystems.com](http://www.klrsystems.com)

## DECOMMISSIONING OF THE PRODUCT

It is advisable to plan a tour of KLR to reinstall the equipment after a prolonged deactivation or a move.

Destruction, recycling, disposal

## SPARE PARTS LIST

Here is the list of parts per machine we do recommend keeping in your facility.

There are options available for your machine. If you need to order a piece, make sure to look in the right list. If you need assistance, see contact information right above.
